Lines from Poisons.

of the fever from Poisons.

I said formerly poisons were animal
mineral - Aerial and vegetable, and
that they acted upon all the systems
specifically. Even the blood is acted
upon specifically by one of them.

Most of them induce disease &
death by acting primarily upon the
Stomach, bowels and blood vessels
in a manner analogous to Thirst.
-miasma ^{and} in a direct & indirect man-

ner. The disease thus induced is either
one of the forms of intestinal fever,
~~The Remedy proper to this~~ ^{arterial}
or one of the primary forms of fever.
For which the following remedies

V ~~cannot~~ exciting another action
in the stomach, or in some
other part of the body.

have been found useful.

I such as discharge the poisonous matter from the stomach when it is confined to it, or destroy its activity ~~to~~ by ^{blunting} ~~raising~~ with it, or decomposing it, or ^{which} render it inert by V

II such as discharge the poisonous matter from the bowels, ~~and in~~

III such as obviate the disease induced in the blood vessels.

To the I Head belong Emetics. These should ^{be} exactly the same as have recommended for discharging and ~~are~~ for the stomach in the latter upon the power induced by Opium. If this be ~~is~~ impracticable, ~~such~~ 2^{ly}?

2 Such ³ should be employed as
to the remedies ~~which are intended~~
to destroy the activity of the poison
by blunting or decomposing it. These
should be regulated by the nature of the
poisonous ^{matters} ~~matter~~. If they be of a
soluble or soluble ^{nature} ~~water~~, dilution with
large quantities of water, or ~~the~~
one or two Draughts of Milk, or
Sweet Oil, or melted butter will be
proper. Certain poisons may be de-
composed, and thus rendered inerti-
ous to the Stomach. For example - if Con-
-cine Sublimates has been swallowed,
a little Vegetable Alkali will detach
the muriatic acid from the mercury

[Faint, illegible handwriting on aged paper]

[Faint, illegible handwriting on the right edge of the page]

the mercury in 4 ^{plate}
and have an inoffensive ~~kind of~~
~~mercury~~ in the stomach. Sulfur
has been advised to destroy in like
manner the activity of Arsenic, but
I doubt much whether a Union can
take place between them so as form an
excrement in the stomach. If the
poison resist these remedies, a new
action should be excited in the sto-
-mach by means of Laudanum or
ardent spirits, - or in the bowels
by acid Glysters, or upon the
skin by blisters - or mustard, or
Spirit of Turpentine, or by means
of flagellation.

[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]

II If the poison should pass thro' the
Stomach, and produce pain and
inflammation in the bowels, the
Remedies should be large quantities
of emilk, sweet oil, or melted ^{butter} water
taken by the mouth and injected in
the way of Glyster. — While I was
a Student of medicine I assisted in the
recovery of a respectable Citizen of
Philad^a who had taken an ounce of
the Sulphate of Zinc instead of an
ounce of purging salts by means of
two of those remedies. [The
injections which were often repeated,
were given by my hands] I have

2.

Dr Robert formerly of the Island of Do-
 -minique informed me, that he had
 prevented death by the same means
 in a man who had drank a pint
 of whey made with half an ounce of
 arsenic which he obtained by scrip-
 -tude from an Apothecary, instead of
 half an ounce of Camor tartar.

In all cases of violent pain from
~~the action of poisons~~
 the action of poisons in the stomach
 or bowels, bleeding will be useful.

It will ~~will~~ prevent inflammation.

- It will abstract morbid excitement
 from the stomach and bowels, and
 it will enable the system longer

and with more safety, to sustain the
 outrage that has been committed upon
 it by the poison. —

I have said the effects of poisons
 appear in the blood vessels in all the
 usual forms of ~~retained~~ fever. The
 poison acts indirectly in thus inducing
 fever, but it sometimes acts directly
 by being introduced into the blood ves-
 sels by means of a wound. Before
 we proceed to mention the remedies for
 the cure of the fever induced by the
 poison, it will be proper to inquire
 into the means of preventing this
 fever by the abstraction of the
 poison before it mixes with the

✓ they escape the morbid effects of the
poison upon the whole system.

4 Lotion, 5 Suction and 6 excision
are all proper according to the nature
of the poison and the seat of the wound.

we come next to mention

8
blood. The remedies employed for this
purpose are 1 a Ligature above the wound
which by pressing upon the Veins, prevents
the poison being suddenly mixed with
the whole mass of blood. 2 Applying
~~bruised~~ any stimulating substance to
the wound so as to excite an inflamⁿ.
in it, and a discharge of the poison
from it. The Indians use bruised, or
chewed Waterroot for this purpose.
A blister or a weak Caustic would
answer much better. 3 burying the
wounded limb in fresh earth, or
applying fresh earth to the wound.
Dogs ^{I said formerly} when bitten by snakes scratch
a hole in the ground, and place the
wounded part in it by which means

and with more safety, to restrain
the outbreak that has been com-
mitted upon it by the poison.

[[[The remedies which are proper
to remove the effects of poisons when
they appear in the blood vessels. ^{These} ~~They~~
should be the same as for fever
from any other cause. If the
pulse be active or depressed, bleeding
should be employed, and afterwards
purgers and sweating medicines. The
last have been generally resorted to,
probably from a belief that the poison
was thus to be expelled only thro'
the pores. ~~It is not~~ The Seneka, &c

Scurvian also the volatile Alkali
 have been employed for this pur-
 -pose. It is not in this manner we
 attempt to expel the miasmata
 which produce bilious & jaund fevers
 from the blood. The attempt would
 be equally fruitless ^{to} ~~in~~ discharging
 any other poison from the body in
 the same way. After bleeding & purging
 sweating will be useful especially if
 nature shows a disposition to it. It
 will act as it does in ^{bilious} fevers by the
 abstraction of ~~quantity~~ ^{the stimulus}
 of quantity, and thus ^{lessen} ~~lessen~~ the
 stimulus of quality.
 When the blood vessels are affected

[Faint, illegible handwriting on the main page]

[Faint, illegible handwriting on the right margin]

with a feble morbid action, the Re-
 -medies should be of a cordial, and
 stimulating nature. The Caustic Vol.
 Alkali has been used with great
 success in France, and latterly in the
 East Indies in the low fever induced
 by the bite of the Cobra de Capello.
 In this fever the blood vessels are
 nearly paralyzed by the poison, so
 that nothing can keep up this ac-
 -tion except the most prompt and
 active stimuli of which the Caustic
 Vol. Alkali is perhaps the best in
 the whole Materia Medica.
 With all these remedies, blisters

V Dymally has mentioned a fact which
shows that a strong irritation made
upon the stomach when poisons have
mixed with the blood, ^{may serve the same purpose,} that a strong
irritation made upon the skin does.
When a poison is lodged in the sto-
mach or bowels. He tells us the
Indians in South America prevent
death from the bite of poisonous
snakes by swallowing large quantities
of Cayenne pepper. The efficacy of
large doses of Bark, Wine & Laudanum
in certain states of malignant fever,
(which act, we know powerfully, upon
the stomach) in saving the system from
disorganisations and death by miasmata
(which are aerial poisons) favours the
reasonableness of this Indian practice.

and other Stimulants applied to the Skin might be used to advantage.

V The more we direct ourselves of a belief ~~that the fever~~ for the prejudices of the Schools upon the specific nature of poisons in inducing ^{fever} ~~disease~~, and in favor of specific remedies ^{for its cure}, and the more we subject that ~~disease~~ ^{fever} all to the laws which regulate other fevers, and the remedies that cure them, the more easily and safely we shall arrive at a certain and successful mode of treating them.

I have hitherto spoken only of the common forms of fever, produced by poisons, but they sometimes

produce the engorgement and the hæmorrhagic
 the manical, the dysenteries, and the
 hydropic states of fever all of which
 require exactly the same treatment
 which I shall recommend hereafter
 for those States of fever. The Hydropic
 State of fever is ^{induced by the bite of an insect called Dipso.} ~~described by an ancient~~
~~poet.~~ It is attended with a great swelling
 and thirst. It is described by one of the
 ancient poets.

We are told by travellers that the
 savages of many countries prevent the
 morbid effects of poisons upon them
 by certain medicines of a vegetable
 nature. Baron Humbolt informed me
 that the Indians in South America ^{drink a decoction}
~~employ~~ certain herbs for this purpose,

V poison of the Mosquito, the Spider
and the Cactus root of Barbadoes
are of this nature. The remedies
for it should be the same as for
Erysipelas, or for the same grade
of any other cutaneous disease.

I lament that our time will
not permit me to descend more mi-
-nutely into this Subject. If you ad-
-mit the Unity of Disease, and the
Unity of Stimulus or irritation in-
ducing Disease all further details
upon it will be unnecessary. I have
given you a principle, and a single
principle in medicine if ~~two~~ true,
is worth a Volume of lifeless, un-
-connected facts.

and afterwards ~~expose~~ permit them-
selves to be bitten by poisonous snakes.
When we consider how few snakes are
poisonous, and how many wounds made
by such as are said to be so, heal of
themselves without doing any harm,
I am disposed to doubt most of the
accounts that have been given upon
this subject. ~~But it~~ It is probable ^{that} they
sometimes may act as emetics or
as sedatives and thus weaken the force
of the disease produced by the poison,
~~in the same manner~~, but it is not
probable they wholly destroy it. —

I have only to add that there
are certain poisons which ^{act primarily on} affect the
skin ~~only~~, and which affect the
blood vessel only by sympathy. The
V
